

Publish Your Hello World Page

By the end of this section you will have a live web page on GitHub Pages and a link that opens it directly.

On a Mac: use `Cmd` wherever this sheet says `Ctrl`, and Finder instead of File Explorer.

YOUR FINISHED LINK

<https://YOUR-USERNAME.github.io/dev-140-yourname-f26/discussion-1/>

your GitHub account

your class repo

this lesson's folder

```
Desktop\DEV 140 - Web Development\
├─ Discussions\           ← open this in VS Code (= repo)
├─ discussion-1\
│   └─ index.html        ← your Hello World page
```

Before you start ☐ VS Code installed ☐ Git installed (Windows: git-scm.com, accept the defaults) ☐ One GitHub account you will use all term

SET UP VS CODE

- 1 Make the folders.**
In File Explorer, create Desktop\DEV 140 - Web Development\Discussions\discussion-1.
- 2 Open Discussions in VS Code, not discussion-1.**
File → Open Folder..., click Discussions, then **Select Folder**. If asked, choose **Yes, I trust the authors**. *The folder you open becomes your repo, so discussion-1 becomes part of your link.*
- 3 Sign in to GitHub.**
Click the **Accounts** icon (bottom left), choose **Sign in with GitHub**, then **Authorize** in the browser. If there is no GitHub option, skip this step; VS Code will ask in step 9.

MAKE THE PAGE

- 4 Create discussion-1/index.html.**
In the Explorer, click discussion-1, then the **New File** icon, and name it index.html (all lowercase). Type `!` and press `Tab` to generate the skeleton, then add this inside `<body>`:

```
<h1>Hello World!</h1>
<p>Welcome to my first web page.</p>
```

Save with `Ctrl+S`. A white dot on the tab means the file is unsaved.

CREATE THE REPO ON GITHUB

- 5 Make a new, empty repository.**
On github.com, click + → **New repository**. Name it dev-140-yourname-f26 with your own name, and choose **Public**. **Leave “Add a README” unchecked**. Then click **Create repository**.
- 6 Copy the HTTPS URL.**
Make sure HTTPS is selected (not SSH). It looks like `https://github.com/YOUR-USERNAME/dev-140-yourname-f26.git`

Never type your GitHub password in the terminal.

GitHub no longer accepts passwords for Git. If the terminal asks for one, press `Ctrl+C` and sign in through the VS Code browser popup or the **Accounts** icon instead.

PUSH FROM VS CODE

- 7 Initialize.**
Open **Source Control** (`Ctrl+Shift+G`) and click **Initialize Repository**. **Don't click “Publish to GitHub”: it creates a brand-new repo instead of using yours.** discussion-1/index.html should appear under Changes.
- 8 Commit.**
Type Add hello world page and click **Commit**. If it asks to stage all changes, click **Yes**.
- 9 Connect and publish.**
Click ... → **Remote** → **Add Remote...**, paste the URL, and name it origin. Click **Publish Branch** and sign in through the browser if asked. Refresh GitHub: you should see the discussion-1 folder.

GO LIVE

- 10 Turn on GitHub Pages.**
In your repo, go to **Settings** → **Pages**. Set Source to **Deploy from a branch** and Branch to **main** with / (root), then click **Save**.
- 11 Open your link.**
Wait for the green ✓ in the **Actions** tab (1–2 min), then visit `https://YOUR-USERNAME.github.io/dev-140-yourname-f26/discussion-1/`. GitHub will say your site is live at the address ending in /dev-140-yourname-f26/. That is only the base address and shows a 404, so always add discussion-1/. *Optional: on your repo's main page, click the gear next to About and paste your link into Website.*

Changing your page later

Edit the file, save with `Ctrl+S`, click **Commit**, then **Sync Changes**. The next lesson goes in Discussions\discussion-2\index.html using the same routine. You only initialize, add the remote, and set up Pages once.

IF SOMETHING GOES WRONG

YOU SEE	DO THIS
“Download Git” instead of Initialize Repository	Install Git, then restart VS Code.
Commit error about user.name / user.email	Open Terminal → New Terminal , run <code>git config --global user.name "Your Name"</code> and <code>git config --global user.email "you@example.com"</code> , then commit again.
VS Code offers to create a repo named like https---github.com-...	You clicked Publish to GitHub, which asks for a new repo's name, not a URL. Press <code>Esc</code> , then follow steps 7–9 (Initialize, Commit, Add Remote, Publish Branch).
Push rejected	The repo was created with a README. Delete it (Settings → Danger Zone), recreate it empty with the same name, then click Publish Branch again.
“Permission denied” or 403	You are signed in to a different GitHub account. Click Accounts, sign out, and sign in with your class account.
Pages asks you to upgrade	The repo is private. Go to Settings → General → Danger Zone → Change visibility → Public.
404 at /discussion-1/	Wait for the green ✓, then press <code>Ctrl+F5</code> . Check that the names are exactly index.html and discussion-1, and that GitHub shows the file inside the discussion-1 folder.
“Unable to write” or file-lock errors	OneDrive is syncing your Desktop. Right-click the OneDrive cloud icon, choose Pause syncing, and try again.
